### **Manufacturing Overlay**

Jul 13, 2021

Department of Defense
OFFICE OF PREPUBLICATION AND SECURITY REVIEW

#### 1. Overview

This overlay was developed in partnership with the Defense Industrial Base (DIB) Cybersecurity (CS) Program, to develop a manufacturing overlay for control systems that is intended to complement (and further refine) their existing security control baselines. The Manufacturing Overlay Focus Group (FG), the driving body of this document, leveraged subject matter experts from across DoD, the Risk Management Framework (RMF) Technical Advisory Group (TAG), and industry partners from the DIB CS Program. As part of this effort, Manufacturing Overlay FG members provided expert domain knowledge on securing manufacturing systems and helped shape key concepts captured in supplemental control language. This resulted in guidance that complements and refines existing security control baselines and addresses security control specifications required to properly secure manufacturing systems.

The purpose of developing this document was to address security needs in DIB manufacturing systems and create a security control Overlay that produces tailored cybersecurity guidance. Overall, this produced a manufacturing systems security control Overlay that provides a standardized approach to securely implementing tailored security controls for manufacturing systems within the DIB that complements the security control baselines established in the Department of Defense Control Systems Security Requirements Guide (SRG).

This overlay applies to manufacturing systems at a Low-Low-Moderate impact value for Confidentiality, Integrity and Availability. Refer to the Risk Management Framework (RMF) Knowledge Service (KS) for additional information regarding the development, background, tailoring, and applicability of the Manufacturing Overlay.

RMF KS: https://rmfks.osd.mil/rmf/Pages/default.aspx.

## 2. Scope and Applicability

This Manufacturing Overlay applies to systems, including control systems of any type, IoT devices, sensors and technologies supporting DoD manufacturing processes. Manufacturing processes may include (list is not exhaustive):

- Additive Manufacturing
- Batch Manufacturing
- Continuous Manufacturing
- Electronic and mechanical parts assembly
- Discrete-based Manufacturing

The objective of the FG is to produce an overlay tailored to the distinct security requirements of manufacturing systems and processes while remaining useful to as many types of manufacturing systems as possible. While manufacturing systems exist in a multitude of environments with varying levels of sensitivity, this overlay is intended to provide information system owners and authorizing officials with preliminary security controls for DoD control systems supporting manufacturing processes. Each DoD organization retains the autonomy to determine its own risk tolerance for manufacturing systems using the

policy requirements articulated by the DoDI 8500 series, guidelines found on the RMF KS, and the parameters of organization-specific cybersecurity programs. Organizations have the ability to tailor controls in or out of the established baseline depending on their requisite security requirements, risk tolerances, and system capabilities. Additional security considerations beyond the scope of this overlay may be required for manufacturing systems operating in more sensitive environments; and future guidance will address systems at higher criticality levels. Compensating controls are especially important because the operating environments of manufacturing systems are different than what is assumed in the baselines.

Organizations should use the Manufacturing Overlay as appropriate based on their requisite security requirements for a particular system or mission need. As in all risk-based management, organizations must analyze their manufacturing systems to determine how this overlay will fit their operational environment.

#### 3. Controls

The Manufacturing Overlay Consists of 344 controls and control enhancements. The security control baseline leveraged information from NIST SP 800-82, *Guide to Industrial Control Systems (ICS) Security*, and was derived from the CNSSI 1253 Low-Low-Moderate security control baseline with a focus on manufacturing system environments. In the table below, an "X" indicates that supplemental guidance was developed for the control to address the unique security requirements of manufacturing systems.

**Table 1: Manufacturing Overlay Control Baseline** 

Manufacturing Overlay		
Control ID	Control Name	Supplemental Guidance Included
AC-1	Policy and Procedures	
AC-2	Account Management	
AC-2 (4)	Account Management   Automated Audit Actions	X
AC-2 (5)	Account Management   Inactivity Logout	X
AC-2 (7)	Account Management   Privileged User Accounts	
AC-2 (9)	Account Management   Restrictions on Use of Shared and Group Accounts	
AC-2 (12)	Account Management   Account Monitoring for Atypical Usage	X
AC-3	Access Enforcement	
AC-3 (4)	Access Enforcement   Discretionary Access Control	
AC-5	Separation of Duties	
AC-6	Least Privilege	

AC-6 (1)	Least Privilege   Authorize Access to Security Functions	X
AC-6 (5)	Least Privilege   Privileged Accounts

## 4. Supplemental Guidance

During the development of the Manufacturing Overlay, 29 controls were identified as requiring additional supplemental guidance. These controls include:

• AC-2 (4)	• AU-11 (1)	• IA-7
• AC-2 (5)	• AU-12 (1)	• IA-8
• AC-2 (12)	• AU-12 (3)	• MA-4
• AC-6 (1)	• AU-14	• RA-5 (4)
• AC-10	• AU-14 (1)	• SC-22
• AC-22	• CA-3	• SI-2 (1)
• AU-2	• CA-9	• SI-3
• AU-4	• CM-3 (4)	• SI-4 (14)
• AU-4 (1)	• CM-5	• SI-4 (15)
• AU-6 (10)	• IA-5 (13)	

The specific control language developed to address the unique security requirements of manufacturing systems can be found in *Table 2: Manufacturing Overlay Supplemental Guidance*.

**Table 2: Manufacturing Overlay Supplemental Guidance** 

	Manufacturing System Supplemental Guidance	
Control ID	Control Name	Supplemental Guidance
AC-2 (4)	Account Management   Automated Audit Actions	The information system automatically audits account creation, modification, enabling, disabling, and removal actions and notifies the system administrator and Information Systems Security Officer (ISSO). Many manufacturing systems do not possess the technological capability to satisfy this control. If the manufacturing system of interest is connected to an information system with automated audit capabilities, this control should be implemented; however, automated audit actions may not be feasible for manufacturing systems that do not interact with an information system possessing these capabilities. As such, this control may not be applicable in particular scenarios.  Related Controls: AU-2, AU-12
AC-2 (5)	Account Management   Inactivity Logout	The organization requires that users log out when at the end of the users' standard work period unless otherwise defined in formal organizational policy. Given the unique uptime requirements of manufacturing systems, system operators may have extended periods where they are logged on in order to execute lengthy manufacturing processes. As such, organizations should carefully consider the operational requirements of their manufacturing systems. Policy addressing logout requirements necessary for maintaining operational continuity in the manufacturing system environment should be defined by the organization.  Related Controls: SC-23

AC-2 (12)	Account Management   Monitoring for Atypical Usage	Organizations should monitor manufacturing system accounts for atypical usage and report atypical usage of manufacturing system accounts to the ISSO, where feasible. Many manufacturing systems do not possess the technological capability to satisfy this control. As such, organizations must consider the applicability of this control based on the monitoring capabilities associated with the manufacturing system environment.  Related Controls: CA-7
AC-6 (1)	Least Privilege   Authorize Access to Security Functions	Security functions include establishing system accounts; configuring access authorizations (i.e., permissions, privileges), configuring settings for events to be audited, and establishing intrusion detection parameters.
		Organizations should carefully consider the security functions that their manufacturing systems possess.  Organizations should also consider the system account types associated with their manufacturing systems. This can vary from multiple user accounts with differing levels of access to one shared account with one password and identical privileges. As such, it is critical that organizations carefully consider the security functions their systems possess when implementing this control.
		Related Controls: AC-17, AC-18, AC-19
AC-10	Concurrent Session Control	Many manufacturing systems have operating systems that do not have the capability for concurrent sessions. This control should only be implemented where feasible. This control addresses concurrent sessions for system accounts and does not address concurrent sessions by single users via multiple system accounts.  Related Controls: None
AC-22	Publicly Accessible Content	This control should be implemented in manufacturing systems that have the capability to push information to a publicly accessible information system. Organizations should carefully consider the risk associated with making information publicly accessible. This control is not applicable to systems lacking this capability.  Related Controls: AC-3, AC-4, AT-2, AT-3, AU-13
AU-2	Event Logging	Organizations should carefully consider the auditing capabilities of their manufacturing systems when establishing event logging practices. Examples of "events"

		include password changes; failed logons or failed accesses related to systems; security or privacy attribute changes; administrative privilege usage; PIV credential usage; data action changes; query parameters; or external credential usage.  Manufacturing systems vary significantly in complexity and technical capability. As such, organizations should determine the types of events that need to be logged to ensure mission success in the manufacturing system environment.  Related Controls: AC-6, AC-17, AU-3, AU-12, MA-4, MP-2, MP-4, SI-4
AU-4	Audit Log Storage Capacity	Many manufacturing systems do not have the capability to specify log storage capacity. Organizations should consider the types of audit logging to be performed and the audit log processing requirements when allocating audit log storage capacity. Allocating sufficient audit log storage capacity reduces the likelihood of such capacity being exceeded and resulting in the potential loss or reduction of audit logging capability.
		In instances where a data historian exists on the manufacturing system and logs can be pulled or the system utilizes storage area networks (SAN) / network-attached storage (NAS) solutions, organizations should implement this control. If the manufacturing system does not have the function to specify log storage capacity, this control is not applicable.
		Related Controls: AU-2, AU-5, AU-6, AU-7, AU-11, SI-4
AU-4 (1)	Audit Log Storage Capacity   Transfer to Alternate Storage	Similar to control AU-4, some manufacturing systems utilize SAN/NAS solutions, data historians, or other data recording capabilities. If so, organizations should transfer audit logs to a different system, system component, or media other than the system or system component conducting the logging. This control is not applicable to manufacturing systems that lack the ability to transfer audit log information to an alternate location.
		Related Controls: none
AU-6 (10)	Audit Record Review, Analysis, and Reporting   Audit Level Adjustment	Organizations should consider the unique auditing capabilities of their manufacturing systems. If the systems of interest do not possess the functionality to adjust the level of audit review, analysis, and reporting, this control is not applicable.

		This enhancement was removed and incorporated into AU-6 in NIST SP 800-53 Rev. 5  Related Controls: none
AU-11 (1)	Audit Record Retention   Long-term Retrieval Capability	Organizations should consider the auditing capabilities of their manufacturing systems. Some manufacturing systems utilize SAN/NAS solutions and have audit log transfer capabilities, allowing for long-term retrieval of audit logs. Other systems have the capability to prevent audit log data from being overwritten until the information is transferred to an alternate storage location. Regarding systems with these capabilities, organizations should define the length of time that audit records need to be retained so they can be retrieved. This control is not applicable to manufacturing systems that lack functionality to retain audit records and/or transfer them to a more permanent medium.  Related Controls: AU-4, AU-4 (1)
AU-12 (1)	Audit Record Generation   System-wide and Time- correlated Audit Trail	Audit trails are time-correlated if the time stamps in the individual audit records can be reliably related to the time stamps in other audit records to achieve a time ordering of the records within organizational tolerances. This control can be very critical for time-based troubleshooting purposes. For manufacturing systems with network connectivity and the capability to pull time stamps from a Network Time Protocol (NTP) server, organizations should ensure this control is implemented in accordance with the time tracking tolerance defined in AU-8.  Organizations should carefully consider the auditing capabilities of their manufacturing systems. Particularly with embedded systems and air-gapped systems, accessible time services may not be technically feasible. As such, this guidance is included based on the time-reporting and audit capabilities of the system and is not applicable to systems lacking this functionality.  Related Controls: AU-8, AU-12
AU-12 (3)	Audit Record Generation   Changes by Authorized Individuals	Manufacturing systems' unique uptime requirements warrant careful considerations in altering logs for reporting. Permitting authorized individuals to make changes to system logging enables organizations to extend or limit logging as necessary to meet organizational requirements. Logging that is limited to conserve system resources may be extended (either temporarily or permanently) to address certain threat situations. In addition, logging may be limited to a specific set of event types to facilitate audit reduction, analysis, and reporting. Organizations can establish time thresholds in

		which logging actions are changed, for example, near real-
		time, within minutes, or within hours.
		Regarding manufacturing systems, particular incidents may require a system administrator to view and/or alter logs for reporting. Organizations should ensure that any changes would be processed by a change-control board or another change management process so all necessary parties are aware of any changes that are made.
		Related Controls: AU-7
AU-14	Session Audit	Session audits can include, but are not limited to, monitoring keystrokes, tracking websites visited, and recording transfers of information or files. To ensure they are complying with applicable federal laws, Executive Orders, directives, policies, regulations, or standards, organizations should consult legal counsel while developing, integrating, and using session auditing activities. Particularly for manufacturing systems, there is always risk of system failure causing physical injury. This control can be critical in legal situations where authorities would want to conduct a session audit to determine negligence.
		In the absence of an ability to execute a full session audit, organizations should implement the control to the maximum extent that is technically feasible. Organizations must maintain accurate audit logs as well as complete and detailed operator schedules to allow, to the greatest extent possible, organizations the ability to ""triangulate"" the session usage to the operator on duty  Related Controls: AC-3, AU-4, AU-5, AU-9, AU-11
AU-14 (1)	Session Audit   System Start- up	Where feasible, manufacturing systems should initiate user session audits upon system start up to provide a full picture of user activity. In the absence of this system capability, information should be captured from the beginning of a users' session on the system. Specific policy to capture the entire user session for audit should be defined by the organization.  Related Controls: none
CA-3	Information Exchange	Organizations should develop connection and boundary limitations at the system level in consultation with appropriate parties (e.g., Authorizing Official (AO), Information System Security Manager (ISSM), Cyber Security Service Provider (CSSP)). Organizations should document and define system interconnections in organizational security policies. Organizations should also

		carefully consider the sensitivity and risks associated with their system environment when defining system interconnections  Related control: AC-3, AC-4, AC-20, AU-2, AU-12, AU-16, CA-7, IA-3, SA-9, SC-7, SI-4
CA-9	Internal System Connections	Internal system connections are connections between organizational systems and separate constituent system components (i.e., connections between components that are part of the same system).
		Organizations operating manufacturing systems should carefully consider the technical capabilities and complexity of each system component in the manufacturing system environment. Organizations should be aware of data flow and connectivity of each system component to see if components have external connectivity that could result in additional vulnerabilities.
		The continued need for an internal system connection should be reviewed from the perspective of whether the connection provides support for organizational missions or business functions. All connections within the boundary should be documented. Organizations may exclude this control if it does not apply to their system.
		Related Controls: AC-3, AC-4, AC-18, AC-19, AU-2, AU-12, CA-7, CM-2, IA-3, SC-7, SI-4
CM-3 (4)	Configuration Change Control   Security and Privacy Representatives	Information security representatives can include senior agency information security officers, information system security officers, or information system security managers. It is important to involve personnel with information security expertise in this process because changes to information system configurations can have unintended side effects, some of which may be security-relevant.
		Detecting such changes early in the process can help avoid negative consequences that could ultimately affect the security state of organizational manufacturing systems. This is particularly important in manufacturing system environments where unintended consequences from system configuration changes could result in physical harm on top of system failure. The configuration change control element in this control enhancement reflects the change control elements defined by organizations in CM-3.
		In the absence of a senior agency official, organizations can define the appropriate security representative based on their

		technically qualified personnel, mission need, system- specific qualifications, and organizational availability.
		Related Controls: none
CM-5	Access Restrictions for Change	Changes to the hardware, software, or firmware components of systems or the operational procedures related to the system, can potentially have significant effects on the security of the systems. Therefore, organizations permit only qualified and authorized individuals to access systems for purposes of initiating changes. Access restrictions include physical and logical access controls (see AC-3 and PE-3), software libraries, workflow automation, media libraries, abstract layers (i.e., changes implemented into external interfaces rather than directly into systems), and change windows (i.e., changes occur only during specified times).  Organizations operating manufacturing systems must carefully consider access restrictions for configuration changes because negative consequences from unauthorized or unintended changes could significantly impact continuity of operations and even lead to physical harm.  Related Controls: AC-3, AC-6, PE-3
IA-5 (13)	Authenticator Management   Expiration of Cached Authenticators	Authenticators include passwords, cryptographic devices, one-time password devices, and key cards. If cached authentication information is out-of-date, the validity of the authentication information may be questionable. User identity must be confirmed prior to any system, roles, or facility authorization is granted. Timeouts of cached credentials ensure user permissions and access are current.  Organizations operating manufacturing systems should determine the time-period in which to prohibit the use of cached authenticators.  Related Controls: None
IA-7	Cryptographic Module Authentication	Authentication mechanisms may be required within a cryptographic module to authenticate an operator accessing the module and to verify that the operator is authorized to assume the requested role and perform services within that role. This control should only be implemented in manufacturing systems that have the technical capability.  Related Controls: SC-12, SC-13

IA-8	Identification and Authentication (non- organizational Users)	Non-organizational users include system users other than organizational users explicitly covered by IA-2. Non-organizational users are uniquely identified and authenticated for accesses other than those accesses explicitly identified and documented in AC-14.  User identity must be confirmed prior to any system, roles, or facility authorization is granted. Particularly in manufacturing system environments, unauthorized system access by a non-organizational user could result in system failure, which could severely impede mission success and even result in physical damage or harm.  Related Controls: AC-2, AC-14, AC-17, AC-18, IA-2, IA-4, IA-5, MA-4, RA-3, SA-12, SC-8
MA-4	Nonlocal Maintenance	Nonlocal maintenance and diagnostic activities are conducted by individuals communicating through a network, either an external network or an internal network.  Authentication techniques used in the establishment of nonlocal maintenance and diagnostic sessions reflect the network access requirements in IA-2. Nonlocal maintenance in manufacturing system environments is commonplace. As such, organizations should implement two-factor authentication (2FA) measures on systems that receive nonlocal maintenance. 2FA is required in order to ensure that administrative accounts are being used with integrity.
		Utilizing 2FA may not be technically feasible for all manufacturing systems. Organizations operating manufacturing systems that lack this capability should establish alternative acceptable authentication measures.  Related Controls: AC-2, AC-3, AC-6, AC-17, AU-2, AU-3, IA-2, IA-4, IA-5, IA-8, MA-2, MA-5, MP-6, PL-2, SC-7, SC-10, SC-17
RA-5 (4)	Vulnerability Monitoring and Scanning   Discoverable Information	Discoverable information includes information that adversaries could obtain without compromising or breaching the system, for example, by collecting information the system is exposing or by conducting extensive web searches.  Organizations should carefully consider the discoverable information in their manufacturing system environments and understand how an adversary could use that information to impact mission success. Additionally, active vulnerability scanning, which introduces network traffic, must be used with caution on manufacturing systems to ensure that

		manufacturing functions are not adversely impacted by the scanning process.
		When scanning is not permitted on active manufacturing systems, organizations should develop system-specific scanning procedures that consider the risk, requirements, and vulnerabilities of individual systems.
		Related Controls: AU-13
SC-22	Architecture and Provisioning for Name/Address Resolution Service	Where feasible, organizations should ensure the systems that collectively provide name/address resolution services in a manufacturing system environment are fault-tolerant and implement internal and external role separation.
		If the systems of interest do not possess or require name/address resolution capabilities, this control is not applicable.
		Related Controls: SC-2, SC-20, SC-21, SC-24
SI-2 (1)	Flaw Remediation   Central Management	Central management is the organization-wide management and implementation of flaw remediation processes. It includes planning, implementing, assessing, authorizing, and monitoring the organization-defined, centrally managed flaw remediation controls.
		Organizations that operate network-connected manufacturing systems should implement a centrally-managed flow remediation process, where technically feasible. In cases where a manufacturing system is airgapped or does not have network connectivity, this control enhancement may not be applicable.
		Related Controls: none
SI-3 (1)	Malicious Code Protection   Central Management	Central management addresses the organization-wide management and implementation of malicious code protection mechanisms. Organizations that operate network-connected manufacturing systems or have the technical capability for centrally managed malicious code protection mechanisms should do so.
		This is important to systems that are connected to networks. A central management of malicious code protection will provide indication of manufacturing systems suffering from malicious logic. This control enhancement may not be applicable to manufacturing system environments where centralized management is not a possibility.
		Related Controls: AU-2, SI-8

SI-4 (14)	System Monitoring   Wireless Intrusion Detection	In manufacturing system environments with wireless connectivity, organizations should incorporate intrusion detection systems to identify rogue wireless device, detect attack attempts, and monitor wireless communications.  This control is not applicable if wireless connectivity is not a factor in the manufacturing system environment.  Related Controls: AC-18, IA-3
SI-4 (15)	System Monitoring   Wireless to Wireline Communications	Wireless networks are inherently less secure than wired networks. As such, organizations should employ an intrusion detection system in their manufacturing system environment to monitor wireless communications traffic as the traffic passes from wireless to wireline (wired) networks.  This control is not applicable if wireless connectivity is not a factor in the manufacturing system environment.  Related Controls: AC-18
